

Hi, As a seasoned Software Engineer with over 3 years of diverse engineering experience, I am applying for the EXAMPLE Position position at EXAMPLE_company.

I am currently a software engineer at an agri-tech startup, Ricult. I enjoy working on interesting and challenging products because I want to improve the way the web works, especially for end users. I love creating new and interesting applications, maybe in the process improving them, playing around with new technologies, and continue my learning.

I have plenty of experience and expertise in building and hacking products. At Ricult, I built an analytics application on top of google maps to view more than 2 million farms across Pakistan and Thailand. I also created a resource monitoring and maintenance dashboard that helped our users with their process pipelines. I worked on the performance and ux of a time critical web app and made it scale and handle more than 2 million data rows. I fixed a feature that had to render more than 20000 farm images, bringing the fetching and rendering speed down to 4 seconds. I performed code analysis to identify and fix overlooked performance issues in our fetch services which were used in all our components.

I hope you have a clear idea about my accomplishments and expertise. I would love to be able to, and am looking forwards to proceed with this opportunity at EXAMPLE_company.

Sincerely,
Talha Aamir
